Introduction

- XML-based digital right expression (or preference) languages, such as ODRL, XrML, P3P, lack machine understandable formal semantics of license agreements for automatic agent processing.

- Generic First Order Logic (FOL) provides formal semantics for the above underlying XML-based standards but it is machine unfriendly.

- Several Ontologies+Rules combinations provide semantic-driven enforcement of access rights control and delegation policies for the permissible service agreements but which is the right one?
Research Goal

☛ To resolve the problem of license agreements written in XML-based ODRL rights expression language that lacks of formal semantics.

☛ To construct an abstract formal semantic layer overlaid on ODRL for license agreement semantics instead of using semantic ambiguity natural language, such as English.

☛ To explore the possible semantic-driven enforcement of digital rights management (DRM) access control and delegation policies via one of the ontologies+rules combinations, i.e., SWRL.

☛ To generalize our results to other digital access rights control and delegation domains, such as privacy protection.
Our Approach

☛ Exploiting XML-based ODRL specifications, including expression language, data dictionary elements, and XML syntax.

☛ Designing rights expression and delegation ontology overlaid on ODRL specifications.

☛ Proposing usage rights and transfer rights delegation policies as SWRL rules.

☛ How about the other hybrid integration approaches, such as AL-log, CARIN, hybrid MKNF, etc instead of SWRL?

Semantic Web Well-Known Layer Cake (2007/03)
License Agreement for Usage (Transfer) Rights

A license agreement indicates the policies (rules) under which a principal $Prin_o$ allows another principal $Prin_{u_i}$ to use an asset $r$ presumably owned by $Prin_o$, where $Prin_o$ is an asset owner, $Prin_{u_i}$ is one of $n$ asset users, where $i \in (1, \cdots, n)$.

A license agreement refers as a policy set showing any number of prerequisites and policies. A prerequisite is either a constraint, a requirement, or a condition. If all of the prerequisites are met, then policies say that the agreement's users may perform the action for the license agreement's assets.
Usage Rights Delegation

We define hasUsageRights as an abstract property describing the generic usage rights for a principal $x$ to use an asset $r$.

The domain class of hasUsageRights property is Party, and the range class is Asset.

The domain class of delegate property is Prin$_o$ and the range class is Prin$_u$, where the delegate does have subPropertyOf (delegate$_g$, delegate$_t$, $\cdots$).

The delegate$_g$ represents generic usage rights delegation property and the delegate$_t$ represents rights transfer delegation property.
Usage Rights Delegation (conti.)

☞ ODRL does not enforce or mandate any policies for DRM, but provides mechanisms to express such policies.

☞ Using ODRL expression language and data dictionary elements as rights delegation ontology’s entities.

☞ The class and property terms in this rights delegation ontology will be considered as antecedents or conclusion(s) in the usage and transfer rights delegation policies (or rules) to enforce real rights delegation inference.
A Rights Delegation Ontology
A Rights Delegation Snapshot

The diagram illustrates the relationships and rights delegation in a rights management system. It shows how different parties, such as Alice, Bob, and Charlie, are associated with rights over assets like eBook, eMovie, eMusic, and eSoftware. The relationships are indicated by directed edges, with arrows showing the direction of rights delegation or transfer. The diagram also includes properties like hasDisplayRights, hasPrintRights, and hasSellRights, which define the nature of the rights.
Transfer Rights Delegation

- The \textit{hasTransferRights} is an abstract property describing the transfer rights delegation of usage rights for a principal \(x\) for an asset \(r\).

- The domain class of property \textit{hasTransferRights} is \textit{Party} and the range class is \textit{Asset}.

- \textit{Prin}_o might use \textit{delegate}_g to transfer usage rights only to \textit{Prin}_{u_i}, where \(i \in (1, \cdots, n)\), but does not delegate his transfer rights to \textit{Prin}_{u_i}, where transfer rights \(\in (\textit{hasSell}_t\textit{Rights}, \cdots)\).

- \textit{Prin}_o might use \textit{delegate}_t property, then any one of the transfer rights permissions \(\in (\textit{hasSell}_t\textit{Rights}, \cdots)\) and usage rights can be further propagated.
Prerequisites Expressions

- **MaxCardinality**: $\leq_{\exists u} \text{hasUsageCount}_{\exists p}.\text{Asset}$

- **MaxCardinality**: $\leq_{\exists t} \text{hasTransferCount}_{\exists p}.\text{Asset}$

- **Cardinality**: $=_{\exists a} \text{hasPrepaid}_{\exists p}.\text{Party}$

- **Validity of time interval**: $\forall \text{Time} \in (t_1, t_2)$:
  
  $\geq_{\exists t_1} \text{hasDateTime}_{\exists p}.\text{Time} \land \exists \leq_{t_2} \text{hasDateTime}_{\exists p}.\text{Time}$
Rights Transfer Delegation Rules

hasUsageRights(?x, ?r) \land hasTransferRights(?x, ?r) 
\implies hasUsageTransferRights(?x, ?r) \quad (o1)

hasUsageTransferRights(?x, ?r) \land delegateg(?x, ?y) \land hasPrepaid(?y, ?a) \land
< \exists_u hasUsageCount(?r) \implies hasUsageRights(?y, ?r) \quad (o2)

hasUsageRights(?x, ?r) \land < \exists_u hasUsageCount(?r) \land \geq \exists_{t_1} hasDateTime(?t)
\land \leq \exists_{t_2} hasDateTime(?t) \implies Permitted(Usage, ?r) \quad (o3)

hasUsageTransferRights(?x, ?r) \land delegate_e(?x, ?y) \land hasPrepaid(?y, ?a) \land
\geq 1 hasTransferCount(?r) \implies hasUsageTransferRights(?y, ?r) \quad (o4)
Content distributor Charlie c makes an agreement with two content consumers, Alice a and Bob b. After each paying five dollars, and then both receiving acknowledgment from Charlie, Alice and Bob are given the usage rights and may each display an eBook asset, Harry Potter and the Deathly Hallows, up to five times. They may each print it only once. However, the total number of actions, either displays or prints done by Alice and Bob, may be at most ten. The usage rights validity period is between 2007/05/07/09:00 - 2007/05/10/24:00.
A Usage Rights Delegation Scenario

✈ Abstract Syntax for license agreement:

greement
between Charlie and \{Alice, Bob\}
about Harry Potter and the Deathly Hallows
with inSequence[prePay[5.00], attribution[Charlie]]
⇒ not[and[Time < 2007/05/07/09:00, Time > 2007/05/10/24:00]]
⇒ with count[10] ⇒
and[foreachMember[Alice, Bob; count[5]] ⇒ display,
foreachMember[Alice, Bob; count[1]] ⇒ print]
A Usage Rights Delegation Scenario

✈ First Order Logic (FOL) for license agreement:

\[\forall x ((x = Alice \lor x = Bob) \implies \\
\exists t_1 \exists t_2 (t_1 < t_2 \land \text{Paid}(5, t_1) \land \text{Attributed}(Charlie, t_2))) \implies \\
\forall t \land \text{hasDateTime}(t) \geq 2007/05/07/09:00 \land \\
\text{hasDateTime}(t) \leq 2007/05/10/24:00 \implies \\
\text{count}(Alice, id_1) + \text{count}(Alice, id_2) + \text{count}(Bob, id_1) \\
+ \text{count}(Bob, id_2) < 10 \implies \\
(\text{count}(Alice, id_1) < 5 \land \text{count}(Bob, id_1) < 5 \implies \text{Permitted}(x, \text{display}, \text{ebook})) \\
\land (\text{count}(Alice, id_2) < 1 \land \text{count}(Bob, id_2) < 1 \implies \text{Permitted}(x, \text{print}, \text{ebook}))\]
A Usage Rights Delegation Scenario

✈ **Ontologies+Rules(SWRL) for license agreement:**

**Ontology for content distributor Charlie’s:**

\[
\begin{align*}
\text{hasDisplayRights} & \sqsubseteq \text{hasUsageRights} \\
\text{hasPrintRights} & \sqsubseteq \text{hasUsageRights} \\
\leq & (\text{hasDisplayCount}_{\{a,b\}.eBook}, \text{hasUsageCount}_c.eBook) \\
\leq & (\text{hasPrintCount}_{\{a,b\}.eBook}, \text{hasUsageCount}_c.eBook)
\end{align*}
\]

\{
\{Alice, Bob\} \xleftarrow{\text{domain}} \text{hasUsageRights} \xrightarrow{\text{range}} R_1,
\text{where } R_1 = & \leq_{10} \text{hasUsageCount}_c \\
\land & \geq 2007/05/07/0900 \text{ hasDateTime}_c.Time \\
\land & \leq 2007/05/10/2400 \text{ hasDateTime}_c.Time \\
\exists & = \alpha \exists = \text{sum}(\exists \leq 5 \text{hasDisplayCount}_i.\{HarryPotter\}), i \in \{a, b\}, \text{where } \alpha: \exists \text{hasDisplayCount}_c.\{HarryPotter\} \xleftarrow{(c1)} \\
\exists & = \beta \exists = \text{sum}(\exists \leq 1 \text{hasPrintCount}_i.\{HarryPotter\}), i \in \{a, b\}, \text{where } \beta: \exists \text{hasPrintCount}_c.\{HarryPotter\} \xleftarrow{(c2)} \\
\exists & = \delta \text{sum}(\alpha, \beta), \text{where } \delta: \exists \text{hasUsageCount}_c\{HarryPotter\} \xleftarrow{(c3)}
\]
A Usage Rights Delegation Scenario

✈ Ontologies+Rules(SWRL) for license agreement:

Rules for content distributor Charlie's:

\[
\text{hasDisplayRights}(?x, ?r) \land \text{hasSell_dRights}(?x, ?r) \\
\implies \text{hasDisplaySell_dRights}(?x, ?r) \leftarrow (c4)
\]
\[
\text{hasPrintRights}(?x, ?r) \land \text{hasSell_dRights}(?x, ?r) \\
\implies \text{hasPrintSell_dRights}(?x, ?r) \leftarrow (c5)
\]
\[
\text{hasDisplaySell_dRights}(?x, ?r) \land \text{delegate_g}(?x, ?y) \\
\land \text{hasPrepaid}(?y, ?a) \land \implies \text{hasDisplayRights}(?y, ?r) \leftarrow (c6)
\]
\[
\text{hasPrintSell_dRights}(?x, ?r) \land \text{delegate_g}(?x, ?y) \\
\land \text{hasPrepaid}(?y, ?a) \implies \text{hasPrintRights}(?y, ?r) \leftarrow (c7)
\]
A Usage Rights Delegation Scenario

✈ Ontologies+Rules(SWRL) for license agreement:

Facts for content distributor Charlie’s:

eBook(HarryPotter)
hasDisplayRights(Charlie, HarryPotter)
hasPrintRights(Charlie, HarryPotter)
hasSell_dRights(Charlie, HarryPotter)
hasDisplaySell_dRights(Charlie, HarryPotter)
hasPrintSell_dRights(Charlie, HarryPotter)
∃ =5 hasPrepaid(Alice)
hasDisplayRights(Alice, HarryPotter) ← (c8)
hasPrintRights(Alice, HarryPotter) ← (c9)
∃ =5 hasPrepaid(Bob)
hasDisplayRights(Bob, HarryPotter) ← (c10)
hasPrintRights(Bob, HarryPotter) ← (c11)
............
Discussion

The Pros and Cons of different license agreement expression languages:

✔ Natural Language: Pros human readable and understandable but Cons machine unfriendly, no formal semantics.

✔ Pure FOL: Pros formal and clear syntax and semantics but Cons machine unfriendly, possibly undecidable computation complexity, and policy writer (reader) needs to be a logician.

✔ Ontologies+Rules: Pros formal semantics for automatic machine processing and understanding but Cons limited expressing power, such as negation-free, function-free, and with limited number of parameter parities.

✔ Rights Expression Languages: Pros XML-based for machine processing but Cons no formal semantics.
Policy Languages for Access Rights Permission

Diagram showing relationships between different policy languages and formalisms, including:
- License Agreement
- Policy
- Language category
- Language Instance

Key languages and formalisms include:
- First Order Logic (FOL)
- Human Readable Abstract Syntax
- Natural Language (NL)
- Controlled Natural Language
- Rights Expression Languages (RELS)
- Creative Commons

Decidable:
- Tractable (polynomial)
- Lithium
- SWRL
- OWL-Lite
- OWL-DL
- RDF(S)
- Datalog Horn Rule
- Rei
- KAoS

Undecidable:
- Intractable (exponential)
- Rights Expression Languages (RELS)
- ODRL
- XrML
- P3P
Conclusion

- The semantic formal model for a license agreement is an ODRL-based rights delegation policy that can be enforced as a combination of ontologies and rules.

- A rights delegation ontology is proposed based on ODRL’s expressions and data dictionary,

- The rights delegation policies are proposed as a set of rules for usage and transfer (or duplicate) rights delegations.

- A real usage rights delegation scenario is demonstrated to justify our formal semantic model.
